E-Commerce Business

Team:- Cyber Guard

Mentor:- Anwar Nizami

❖AI Models that can be developed using the data.

1. **Hesitation Detection:-**
   It will use data like time spent on product page, mouse movement and hover, scrolling behaviour, click patterns
2. **Purchase Prediction:-**

   Will this user buy the product or leave without buying?

So instead of waiting for the user to decide, your system predicts their decision in advance.

(Note:- But I think that it would not be that useful because we can never predict about the customer mindset)

But still we can use the below techniques in it:-

If user is likely to BUY:

- Show:
  - "Hurry! Only 2 left"
  - Fast checkout option

If user is likely to LEAVE:

- Show:
  - Discount ("Get 10% off now")
  - Reviews or ratings
  - Trust badges
  - Goal: Stop them from leaving

3. Smart Recommendation System:-

a. Normal System:

- Based on past purchases and trends
- Same recommendations for many users

b. Smart System:

- Based on user behaviour (time, clicks, hesitation)
- Personalized recommendations for each user
